Pig FinServ

Auditable complaint triage and insights

C4-style architecture overview

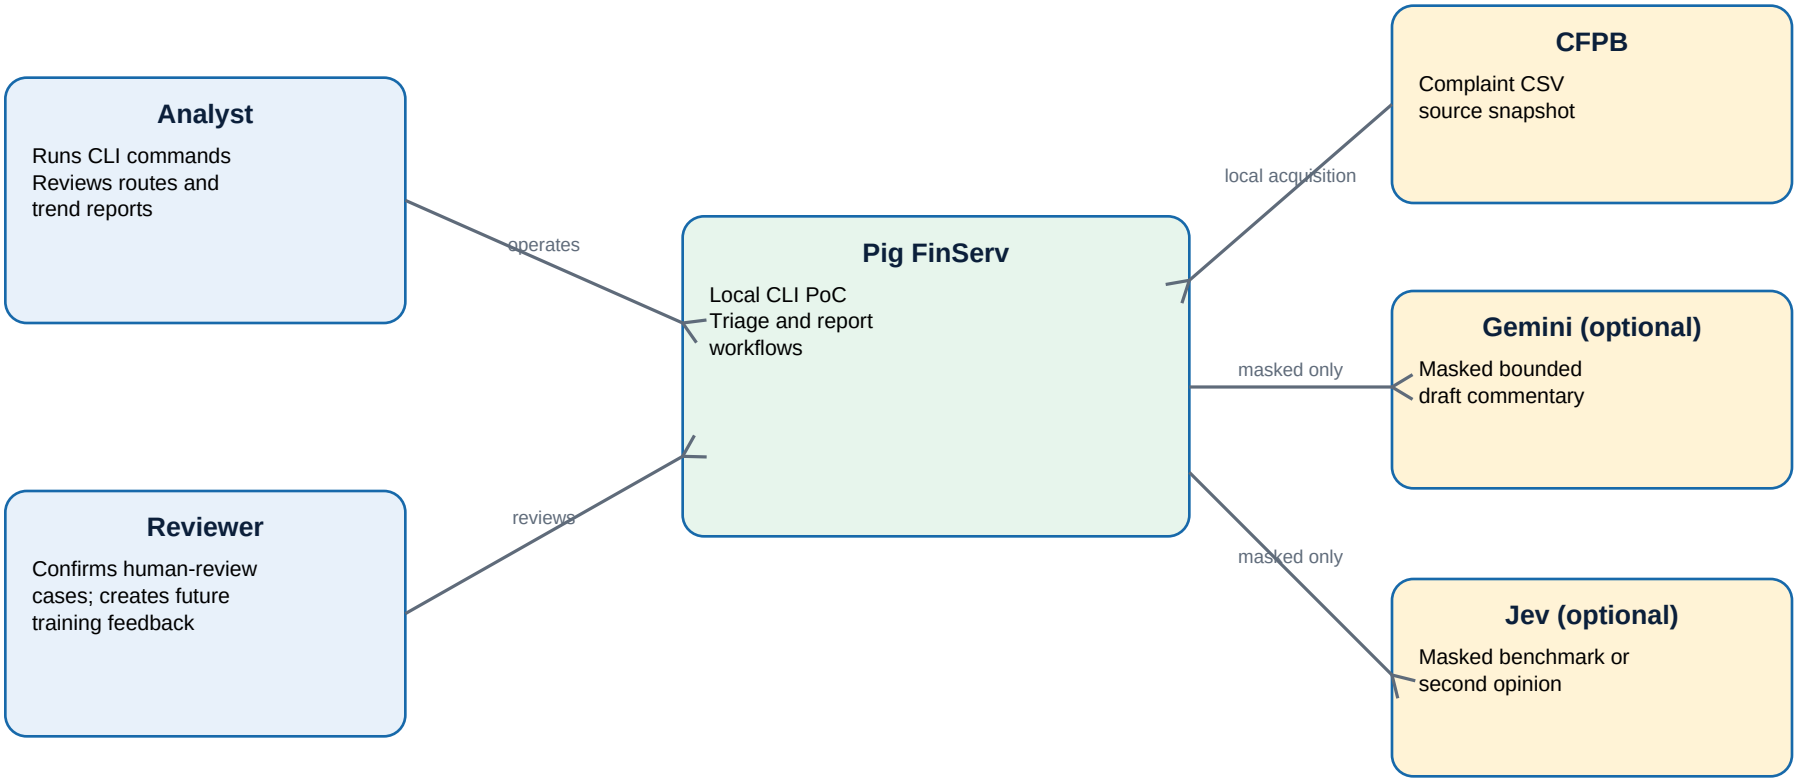
Version 1.0 | November 2026

Design intent

A local, calibrated product-routing model turns consumer complaint text into an auditable route suggestion. DuckDB-backed reporting produces transparent trend metrics and charts. Optional providers are bounded, masked, and never own routing or deterministic calculations.

C4 Level 1 - System context

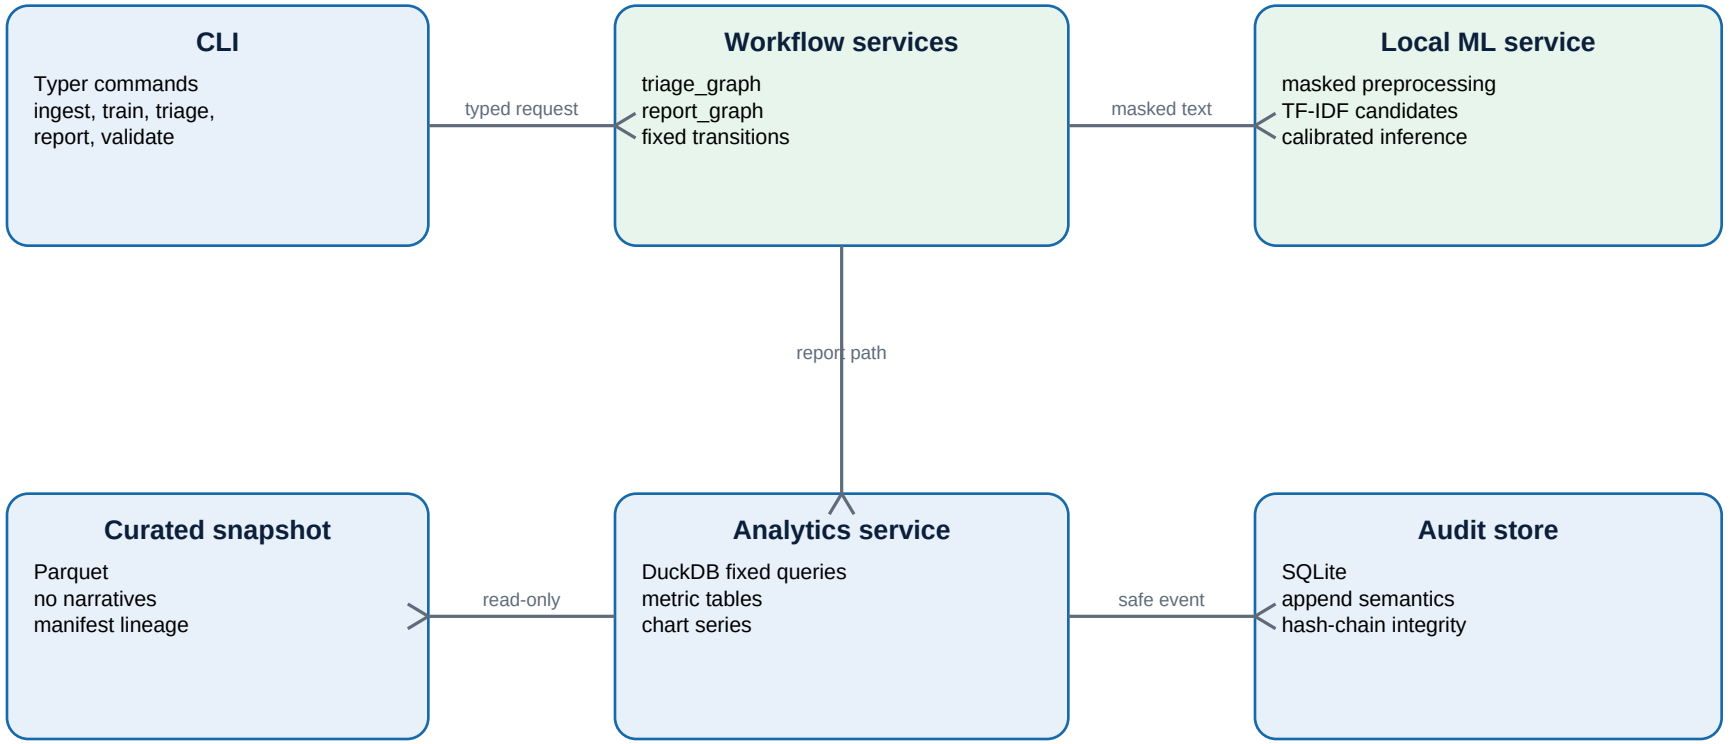
People and external systems



- No raw narrative leaves the local PII guard.
- Gemini and Jev cannot query data, choose routes, or call tools.

C4 Level 2 - Containers

Deployable responsibilities and data boundaries

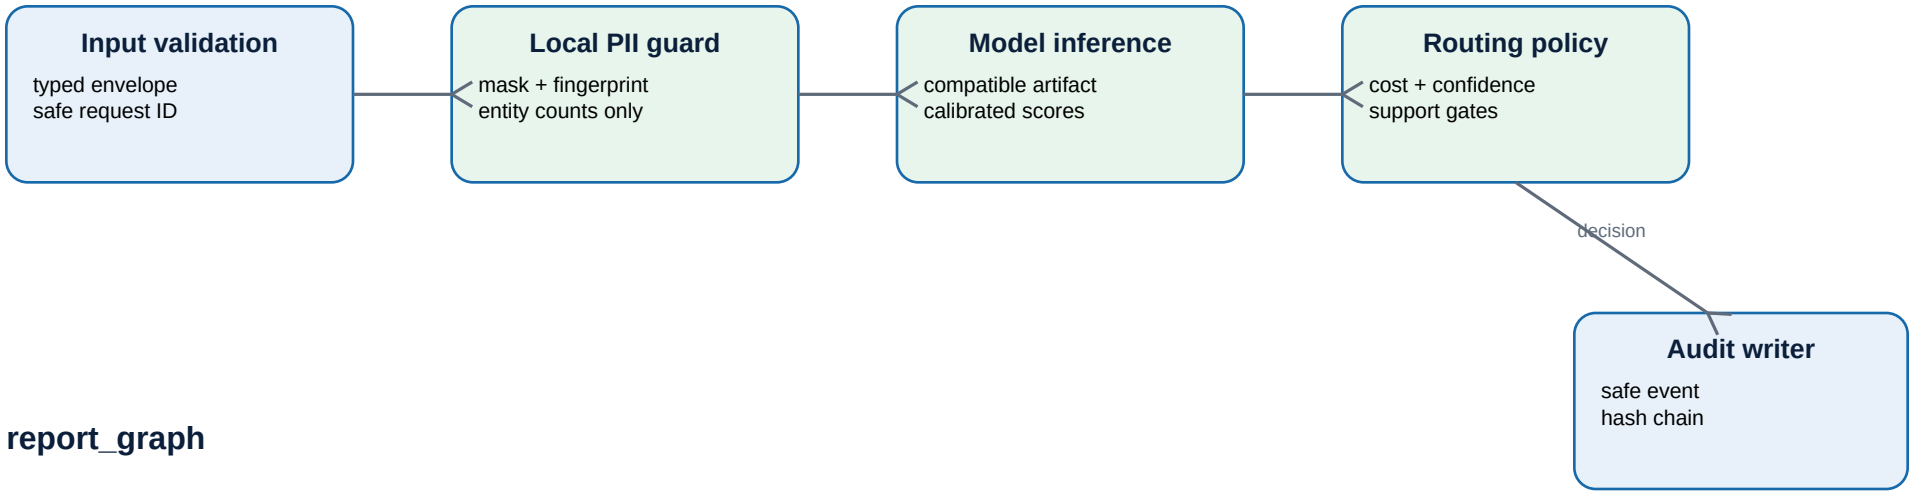


- Training source is a local restricted zone; model artifacts contain no raw narrative.
- Model loads verify checksums and taxonomy compatibility before inference.

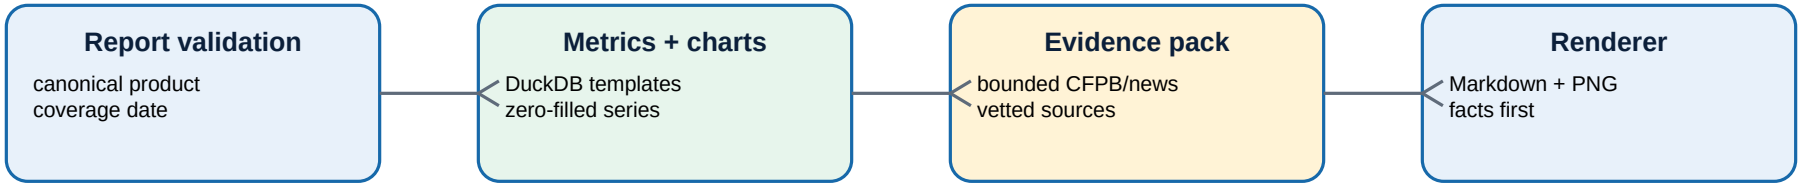
C4 Level 3 - Workflow components

Named orchestrators and bounded integrations

triage_graph



report_graph



- Optional Gemini commentary enters only after metrics/evidence validation and can be absent.
